1 Executive Summary

This post-construction monitoring report has been prepared by Beatrice Offshore Windfarm Limited (BOWL) as part of the Project Environmental Monitoring Programme (PEMP) required as part of Section 36 Consents. This report describes the post-construction element of condition 27 PEMP in relation to sandeel. The completion of this survey also satisfies condition 36 of BOWL's Section 36 consent in that a pre-construction and post-construction sandeel survey must be conducted.

The overall survey methodology and survey equipment used replicated that previously agreed with Marine Scotland Science (MSS) and Marine Scotland Licensing and Operations Team (MS-LOT) for the undertaking of the pre-construction survey. However, following updated advice from MSS, the post-construction survey was undertaken in December instead of February/March. In addition, some sampling locations were shifted to avoid wind farm infrastructure.

A total of 61 stations were sampled, using a modified shellfish dredge (sandeel dredge). Dredging was carried out during night hours when the majority of sandeels were expected to be buried in the sediment.

A total of 3,556 sandeels were caught during the survey at 58 out of the 61 stations sampled.

Four species of sandeels were caught during the survey:

- Raitt's sandeel (*Ammodytes marinus*);
- Lesser sandeel (*Ammodytes tobianus*);
- Smooth sandeel (*Gymnammodytes semisquamatus*); and
- Greater sandeel (*Hyperoplus lanceolatus*).

The most abundant species caught during the survey was *A. marinus* (3,397 individuals, accounting for 97.31% of the total sandeel catch). *A. tobianus*, *G. semisquamatus*, and *H. lanceolatus* were all recorded in very low numbers (88 individuals, 2.52%; 8 individuals, 0.14%; and 1 individual, 0.03%), respectively.

Overall, sandeels were found in higher numbers in stations in the south-eastern section of the site. This is consistent with the results of the 2014 pre-construction survey. During post-construction, however, sandeels were found in higher numbers than pre-construction. From the results of the post-construction survey there is no evidence to suggest that the construction of Beatrice Offshore Wind Farm has resulted in negative impacts on the local sandeel population.

2 Introduction

This post-construction monitoring report has been prepared by Beatrice Offshore Windfarm Ltd (BOWL) as part of the Project Environmental Monitoring Programme (PEMP) required as part of the Section 36 Consent.

This report describes the post-construction element of condition 27 PEMP in relation to sandeel. The completion of this survey also satisfies condition 36 of BOWL's Section 36 consent in that a pre-construction and post-construction sandeel survey must be conducted.

This report has been written by Brown and May Marine Ltd (BMM).

The post-construction sandeel survey was undertaken between the 8th December 2020 and the 17th of December 2020 within the BOWL site.

The survey methodology replicates that of the pre-construction survey, however, on updated advice from Marine Scotland Science (MSS) and Marine Scotland Licensing and Operations Team (MS-LOT) the post-construction survey was carried out in December instead of February/March.

A Marine Scotland (MS) derogation to catch and land undersized and out of quota fish utilising specified cod-end mesh sizes was granted prior to the commencement of the survey, in accordance with the terms of Section 9 of the Sea Fish Conservation Act 1967 and Article 43 of Council Regulation No. 850/98.

Following discussions with the MS Access to Fisheries teams, the EU landing obligation (i.e. discard ban) was not derogated against through allocation of scientific Total Allowable Catch (TAC). Species caught were either landed against the survey vessel's quota, or discarded at sea, as required by the EU landing obligation, as given in the MS derogation for the survey.

A summary of the Health and Safety performance of the survey is provided in Appendix 1.

3 Background Information

The International Council for the Exploration of the Sea (ICES) have divided sandeel stocks in the North Sea into seven Sandeel Assessment (SA) Areas. These are shown in Figure 3.1. The sandeel population in the Moray Firth is part of the wider SA 4, which covers part of the northern and central North Sea (ICES 2021). As shown in Figure 3.1, there is a large area closed to sandeel fishing within SA 4. However, this does not overlap with the Beatrice Offshore Wind Farm.

Figure 3.1: ICES Sandeel Assessment Areas (closed area shown with hatched markings; ICES 2021)

Landings from SA 4 peaked in 1996 at 158,490 t and remained consistently high until 2003 (ICES 2021). Between 2004 and 2016 the highest catch seen per year was only 6,882 t, as there was a reduction in total allowable catches (TAC) recommended by ICES. Landings of <1,000 t were recorded between 2006 -2011 (ICES 2013). Table 3.1 shows the change in sandeel TAC and actual catch for SA4 between 2014 and 2020 when the two surveys took place.

Table 3.1: ICES sandeel TAC and landings from SA4 2014-2021

Year	TAC (t)	ICES catch SA 4 (t)
2014	5,000	4,414
2015	5,000	4,392
2016	6,000	6,232
2017	54,043	18,474
2018	59,345	42,298
2019	5,000	6,666
2020	39,611	19,707
2021	<77,512	

Five species of sandeel have been identified in the North Sea: Raitt's sandeel (*Ammodytes marinus*), greater sandeel (*Hyperoplus lanceolatus*), smooth sandeel (*Gymnammodytes semisquamatus*), lesser sandeel (*Ammodytes tobianus*) and Corbin's sandeel (*Hyperoplus immaculatus*). *A. marinus* is considered to be by far the most abundant species found in the North Sea (Green 2017, Heath *et al.* 2011).

During the winter, adult sandeels burrow in the substrate in response to changing environmental conditions and food availability, emerging in December and January to spawn. In addition, they emerge fully in the spring and summer to feed during the day when the availability of their prey increases (Van der Kooij *et al.* 2008, Gauld & Hutcheon 1990, Bergstad *et al.* 2001, Winslade 1974). Sandeel eggs are adhesive and stick to the bottom substrate where they incubate for a couple of weeks before hatching as planktonic size larvae in February and March (Macer 1965, Langham 1971, Wright & Bailey 1996). Sandeels require the presence of a specific substrate for burial and therefore sandeel distribution and spawning grounds tend to occupy discrete patchy areas rather than be continuous.

MSS has conducted annual sandeel surveys in December in SA4 (Firth of Forth and Turbot Bank) since 2008. The location of the stations sampled during MSS survey in 2019 can be seen in Figure 3.2.

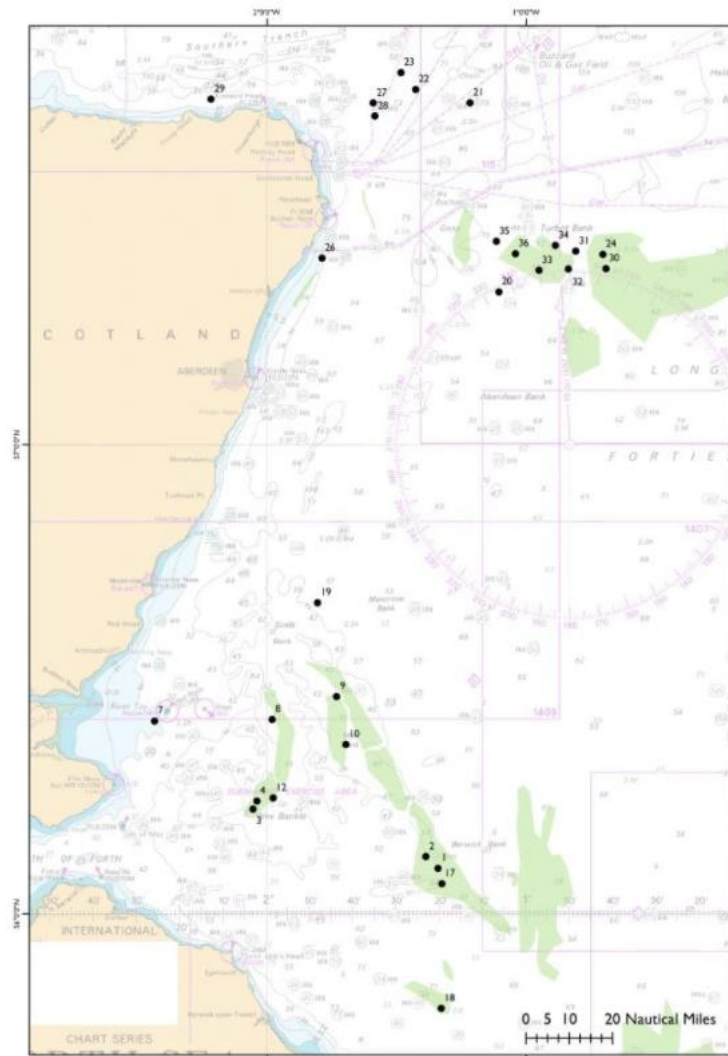

Figure 3.2: Sandeel dredge stations sampled by MSS in 2019. Areas historically fished for sandeel are shown in green (Marine Scotland 2019)

4 Scope of Works

Planned sampling locations were based on a 2.1 km² grid, overlaid on the BOWL site, giving a total of 103 sampling stations. Some stations were relocated from the pre-construction position to avoid wind farm infrastructure (e.g. turbines and cables). The pre-construction sampling locations were plotted against the wind farm infrastructure and each location was reviewed with the skipper of the survey vessel. If a dredge station was considered to be too close to a turbine or subsea cable (within 250 m and 100 m, respectively), the station was moved to the nearest feasible location. The sandeel dredge locations for the pre- and post-construction surveys are provided in Section 7.

The planned scope of the survey included:

- Sandeel dredge:
 - 103 tows of approximately 500 m within the BOWL site.
- Sample analysis:
 - Number of individuals, and number of individuals by swept area (m²), by species;
 - Length (mm) distribution by species; and
 - Weight (g) distribution by species.

5 Survey Methodology

The survey was undertaken from 8th December to 17th December 2020. A summarised log of events is given in Appendix 2 - Log of Events

The survey methodology was designed in consultation with MSS. A dispensation from MSS, in accordance with the terms of Section 9 of the Sea Fish Conservation Act 1967 and Article 43 of Council Regulation No. 850/98, to fish in Area IVab related to days at sea was obtained prior to commencement of the survey.

As previously mentioned, sandeels spend the majority of the year buried in the seabed, emerging briefly to spawn in the winter and feed in late spring and summer. The survey was undertaken during night hours in mid-December following updated advice from MSS and MS-LOT.

5.1 Vessel & Equipment

Following discussions with BOWL, the fishing vessel (FV) “Reaper” WK83 (Figure 5.1) was chartered for the undertaking of the post-construction sandeel survey. FV Reaper is a steel hulled, 16.8 m Wick based whitefish trawler, with the appropriate certification, equipment and experience of fishing in the Moray Firth.

Figure 5.1: Survey vessel – “Reaper”

Table 5.1: Survey vessel specifications

Survey Vessel Specifications	
Length	16.75 m
Beam	7.00 m
Draft	4.15 m
Main engine	Caterpillar 3412C kW - 403
GPS	2 x Furuno GP-39
Radar	JRC (64 mile) Furuno (64 mile with ARPA)
Plotters	2 x Sodena 1 x Furuno MaxSEA TIMEZERO (with wassp/3D mapping)
Sounder	Furuno Waasp and JRC twin screen sounder
Berths	8

5.2 Sampling Gear

A modified 1.24 m shellfish dredge with a fixed tooth bar (6" teeth), 10 mm mesh and a 6 mm mesh cod-end liner was used for sampling (Figure 5.2). The specifications of the modified gear (also known as a sandeel dredge) are given in Table 5.2. The dredges, steel bellies and nets were manufactured using agreed specifications, in line with the gear used by MSS in their sandeel surveys. Details on the required specifications were discussed during a meeting held with MS-LOT, MSS and their gear technician (Meeting 3rd May 2011). The dredges used for the post-construction sandeel survey were the same as those used for the pre-construction survey.

Figure 5.2: Sandeel dredge

Table 5.2: Sampling equipment specifications

Modified 1.24 m shellfish dredge specifications	
Towing warp	Steel 14 mm main with 24 mm extension
Depth: payout ratio	approx. 3/4:1
Net	10 mm mesh with 6 mm cod end liner and chain mat
Estimated headline height	0.5 m
Dredge width	1.24 m
Tooth length	6"

5.3 Sampling Procedures

5.3.1 Positioning and Navigation

The position of the vessel was tracked at all times using a Garmin GPSMap 278 with an EGNOS differential connected to an external Garmin GA30 antenna. Dredge start times and positions were taken when the winch stopped paying out the gear. Similarly, dredge end times and positions were taken when hauling of the gear commenced. The start and end times, co-ordinates and duration of each sandeel dredge are given in Appendix 3 below

At each sampling station a 500 m dredge tow was undertaken. The sampling locations are shown in Figure 5.3.

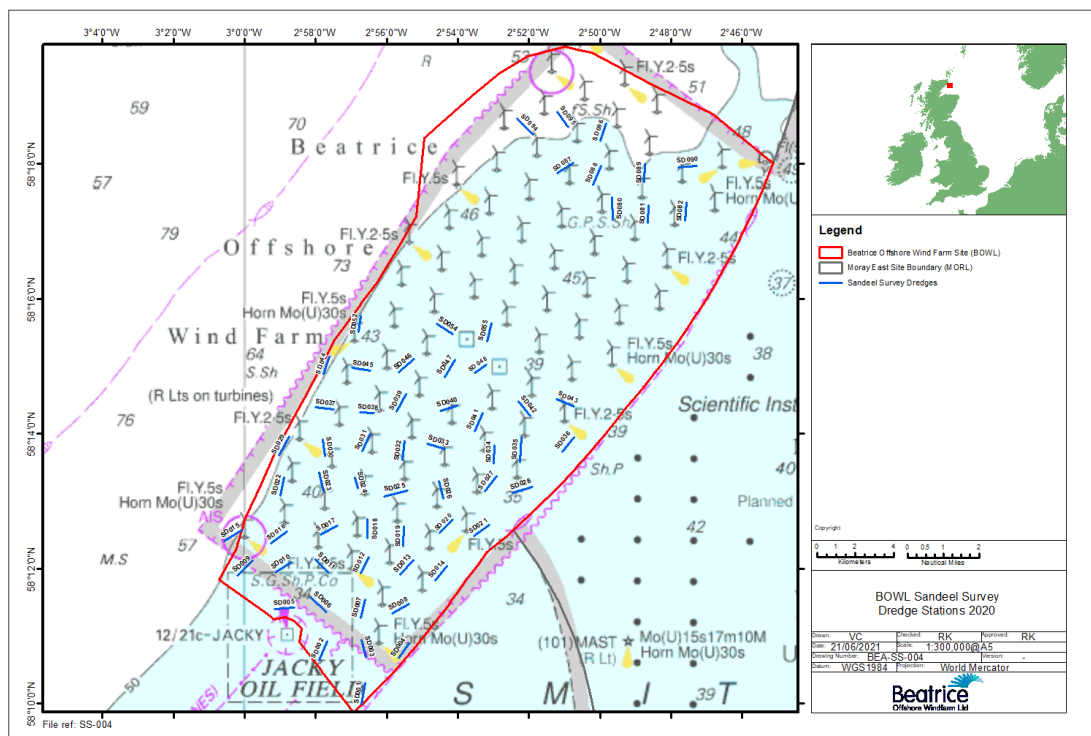

Figure 5.3: Vessel tracks and locations of shooting/hauling the dredge

It should be noted that static fishing gear was present at the time of the survey, at or nearby various of the planned sampling stations. In order to minimise potential interactions with fishing gear and associated safety issues, it was only possible to take samples at 61 of the 103 sampling stations initially planned as part of the survey. MSS confirmed that sufficient data have been collected by the developer to inform both the pre-construction baseline and identify post-construction changes to sandeel occurrence and acknowledged the importance of avoiding impacts to other marine users (MSS letter, 30 April 2021).

5.3.2 Sandeel Dredge Sampling

A total of 61 tows, of approximately 500 m each, were undertaken within the BOWL site. The dredge tow tracks are given in Figure 5.3. The sandeel dredge sampling was undertaken during night hours from the 8th December 2020 to 17th December 2020, when the majority of sandeels were expected to be buried in the sediment.

The catch from each tow was emptied into a bucket, photographed, and any sandeels present were retained. The sandeels from each dredge were removed from the sample, put into a labelled (station and date) polythene bag, sealed and frozen for subsequent onshore species identification, numeration, length and biomass analysis by Jacobs Engineering Ltd. For small samples, the entire sample was frozen for subsequent onshore measuring and weighing. For larger samples, the entire catch was counted by species (where possible) and sub-samples of 2 litre volumes were frozen for onshore analysis. All bycatch species were identified, counted, measured and either returned to the sea or retained in line with the EU landing obligation.

5.3.3 Sandeel Abundance and Distribution

Catch per unit effort (CPUE) was calculated by area (m²; density) for each sandeel species by station.

The CPUE by area (n/m²) for each sample was calculated by dividing the total number of sandeels caught by the swept area (dredge width; 1.24 m, multiplied by tow track length in metres):

$$\frac{\text{Total number of sandeels}(n)}{\text{area swept (m}^2\text{)}}$$

6 Sandeel Dredge Results

6.1 Abundance and Spatial Distribution

A total of 3,556 sandeels were caught during the survey. There were 65 individuals that could not be identified to species level, and have therefore been omitted from further analysis. The total number of sandeels that could be identified to species level was 3,491 individuals, these were caught at 58 out of the 61 stations sampled. The highest number of individuals were recorded at stations SD018 and SD028 (397 and 393, respectively).

The following four species of sandeels were caught during the survey:

- Raitt's sandeel (*Ammodytes marinus*);
- Lesser sandeel (*Ammodytes tobianus*);
- Smooth sandeel (*Gymnammodytes semisquamatus*); and
- Greater sandeel (*Hyperoplus lanceolatus*).

Sandeel abundance by species is provided in Table 6.1 and illustrated by station in Figure 6.1. As shown, *A. marinus* accounted for the majority of the sandeel catch (3,397 individuals, 97.31% of the total catch). The remaining three species (*A. tobianus*, *G. semisquamatus* and *H. lanceolatus*) were all recorded in comparatively low numbers (88, five and one individual, respectively). By-catch abundance data for fish and invertebrate species is given in Appendix 4.

As shown in Figure 6.1, sandeels were found to be most abundant in the south eastern section of the BOWL site and *A. marinus* was consistently the species found in highest numbers across all the stations.

Table 6.1: Total numbers of individuals caught by species

Common Name	Scientific Name	Number of Individuals Caught
Raitt's Sandeel	<i>Ammodytes marinus</i>	3,397
Lesser Sandeel	<i>Ammodytes tobianus</i>	88
Smooth Sandeel	<i>Gymnammodytes semisquamatus</i>	5
Greater Sandeel	<i>Hyperoplus lanceolatus</i>	1
Total		3,491

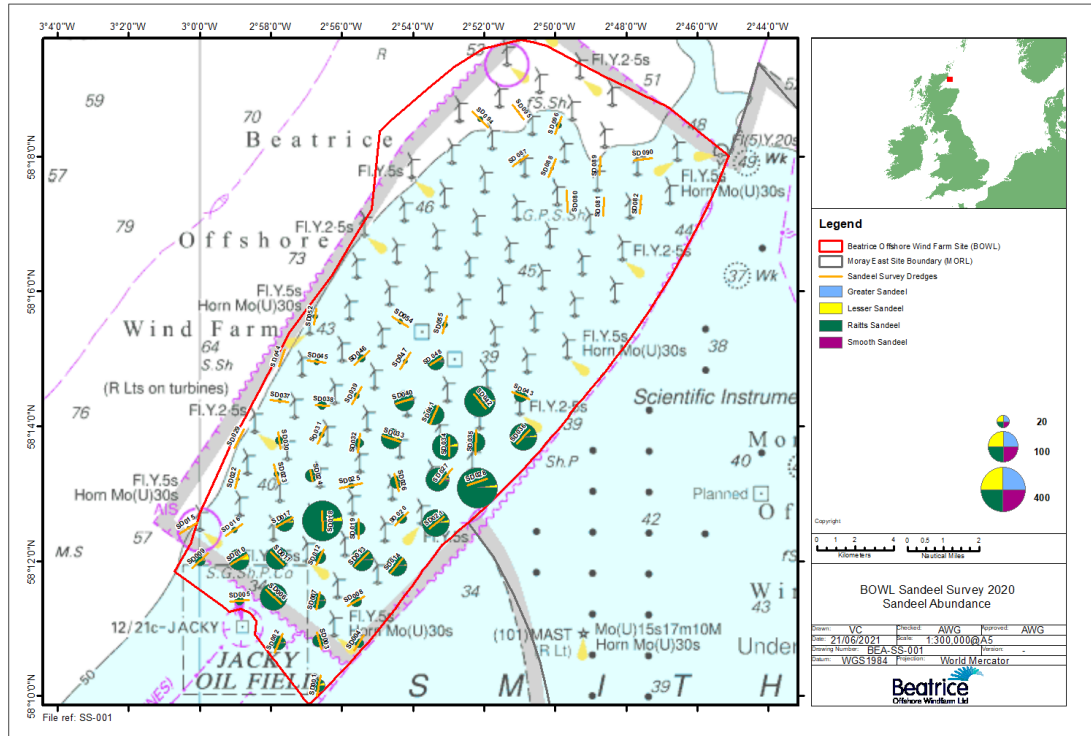

Figure 6.1 Sandeel abundance per station – 2020 survey

Catch rates by swept area (individuals/m²) for each individual station are provided in Table 6.2. As shown, the greatest catch rates were recorded at stations SD018 (0.59 sandeels/m²) and SD28 (0.56 sandeels/m²).

Table 6.2: Number of individuals and catch rate (n/m²) by species and station

6.2 Sandeel Length Distribution

The length range (mm) by species is given below in Table 6.3. The length distributions of *A. marinus* and *A. tobianus* caught during the survey, expressed as number of individuals caught, by length (mm) are shown in Figure 6.2 and Figure 6.3.

As shown, the majority of *A. marinus* and *A. tobianus* caught were between 60 and 99 mm in length.

Length distribution graphs for *G. semisquamatus* and *H. lanceolatus* have not been produced given the small sample of individuals recorded for these two species during the survey (five and one individuals, respectively).

Table 6.3: Length range by species

Species		Length Range (mm)	
Common Name	Scientific Name	Min.	Max.
Raitt's sandeel	<i>Ammodytes marinus</i>	38.0	192.0
Lesser sandeel	<i>Ammodytes tobianus</i>	66.0	98.0
Smooth sandeel	<i>Gymnammodytes semisquamatus</i>	76.0	195.0
Greater sandeel	<i>Hyperoplus lanceolatus</i>	150.0	150.0

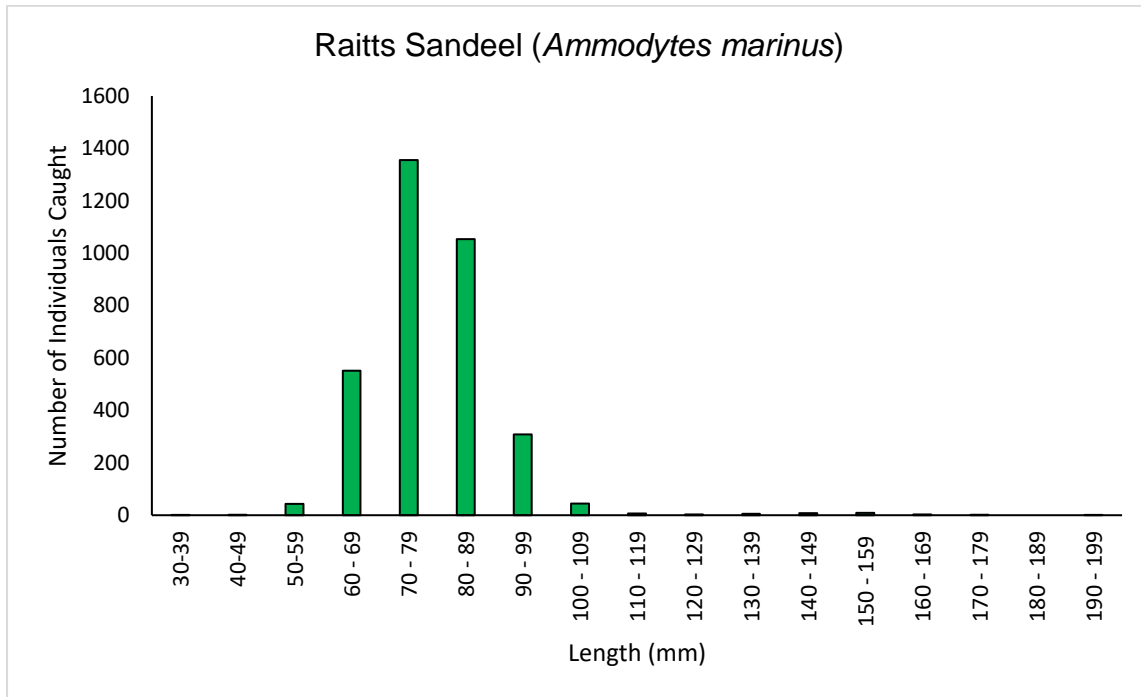

Figure 6.2: Raitt's sandeel (*A. marinus*) length distribution

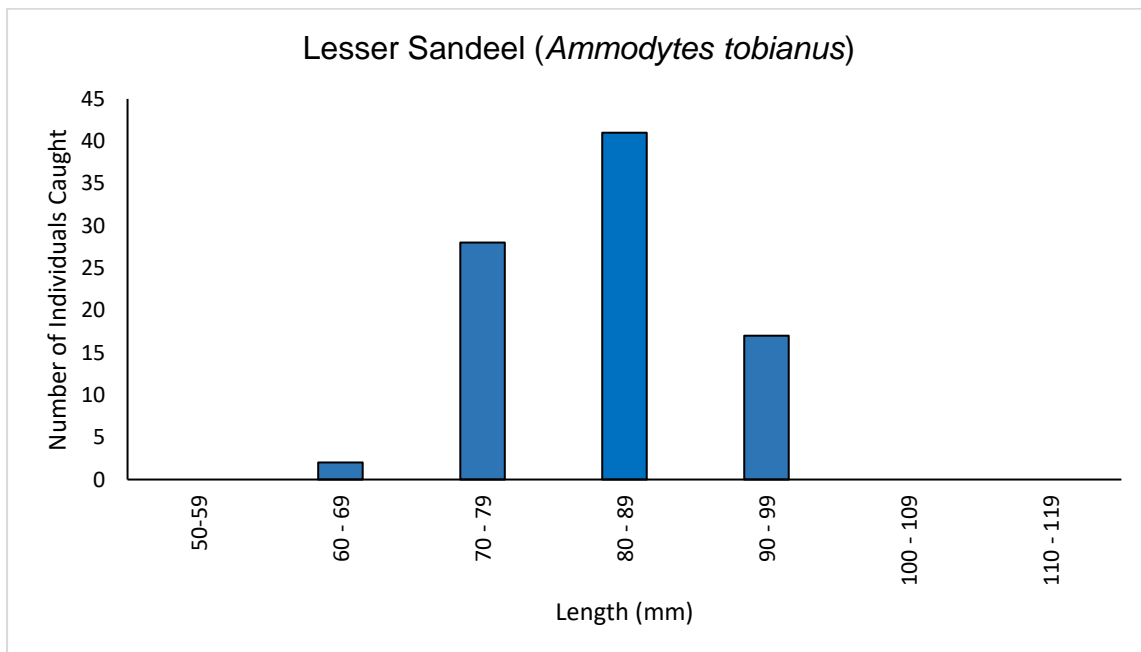

Figure 6.3: Lesser sandeel (*A. tobianus*) length distribution

6.3 Wet (Defrosted) Weight Distribution

The wet (defrosted) weight range (g) by species is given below in Table 6.4. The weight distributions of *A. marinus* and *A. tobianus* caught during the survey, expressed as the number of individuals by wet (defrosted) weight (g), are shown in Figure 6.4 and Figure 6.5.

The majority of *A. marinus* caught had a wet weight of between 1.0 and 4.0 g and the majority of *A. tobianus* of between 1.0 and 1.5 g.

Table 6.4: Wet (defrosted) weight (g) ranges by species

Species		Wet (Defrosted) Weight (g)	
Common Name	Scientific Name	Min.	Max.
Raitt's sandeel	<i>Ammodytes marinus</i>	0.1	27.2
Lesser sandeel	<i>Ammodytes tobianus</i>	0.5	3.0
Smooth sandeel	<i>Gymnammodytes semisquamatus</i>	0.7	23.2
Greater sandeel	<i>Hyperoplus lanceolatus</i>	9.8	9.8

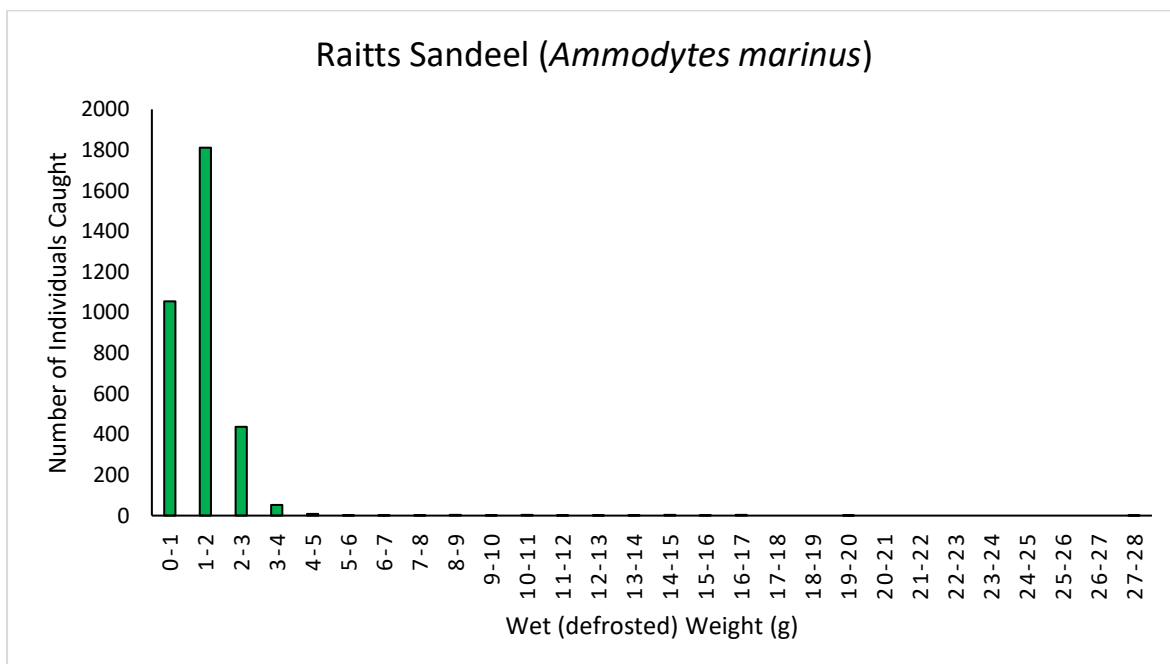

Figure 6.4: Raitt's sandeel (*A. marinus*) wet (defrosted) weight (g) distribution

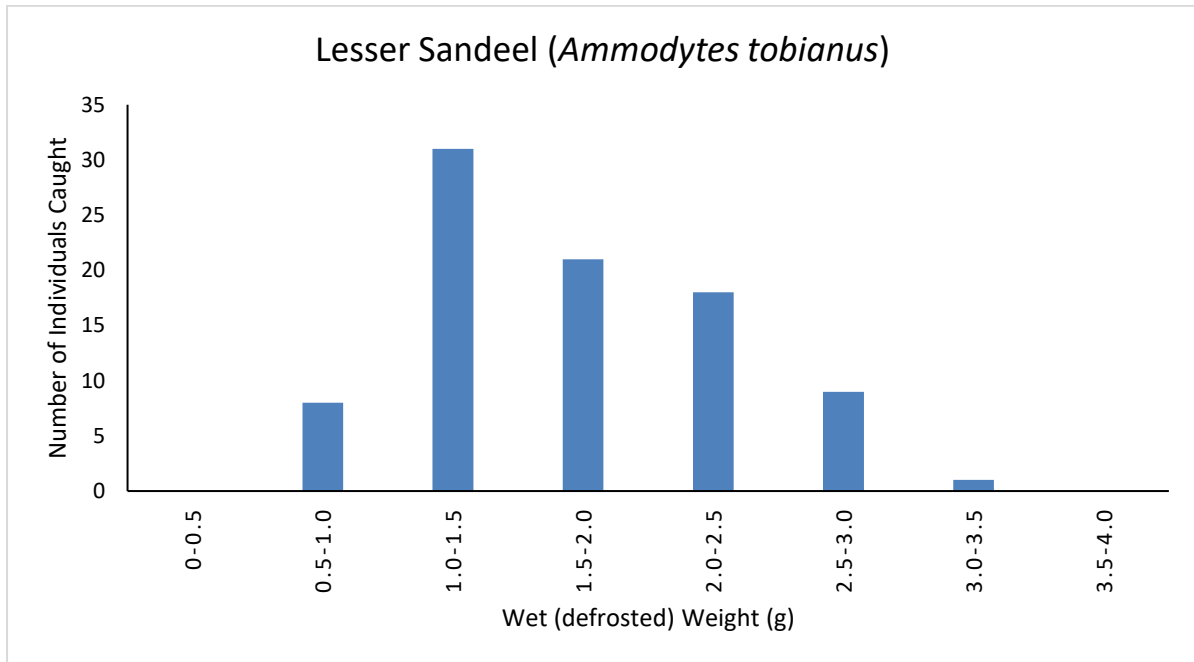

Figure 6.5 Lesser sandeel (*A. tobianus*) wet (defrosted) weight (g) distribution

7 Comparison of 2020 post-construction survey results to 2014 pre-construction survey results

7.1 Sandeel Species

In 2014, three species of sandeels were caught; *A. marinus*, *A. tobianus* and *H. lanceolatus*. In 2020, an additional species, *G. Semisquamatus*, was also found during the survey. *A. marinus*, however, accounted for the vast majority of the sandeel catch across both surveys, with the remaining species recorded in comparatively low numbers (see section 7.2).

7.2 Sandeel Abundance and Spatial Distribution

A comparison of the total number of sandeels caught and catch rates (n/m^2) in 2014 and 2020 is provided in Table 7.1.

As shown, in 2014 (pre-construction), a total of 497 sandeels were caught during the sandeel survey. This has increased to 3,556 individuals in 2020 (post-construction). In this context it is important to note that in 2020 only 61 stations were sampled in comparison to 103 sampled in 2014. The majority of the individuals recorded in 2014 (374 out of a total of 497 individuals) were however caught at stations that were sampled in 2020. The location of the stations sampled during each survey is provided in Figure 7.1.

In line with the above, the catch rate of *A. marinus*, the principal species caught across both surveys, increased in 2020 to $0.090 n/m^2$ from $0.006n/m^2$ in 2014.

Table 7.1: Number and catch rates of sandeels caught in 2014 and 2020

Species		Total Number of Sandeels		Sandeel catch rate by Area (n/m^2)	
Common Name	Latin Name	2014	2020	2014	2020
Raitts Sandeel	<i>Ammodytes marinus</i>	385	3,397	0.00600	0.08559
Lesser Sandeel	<i>Ammodytes tobianus</i>	0	88	0.00000	0.00222
Sandeel sp. (<i>individuals not identified to species level</i>)		0	65	-	-
Smooth Sandeel	<i>Gymnammodytes semisquamatus</i>	111	5	0.00200	0.00013
Greater Sandeel	<i>Hyperoplus lanceolatus</i>	1	1	0.00000	0.00003
Total		497	3,556		

As previously described in Section 6.1, the majority of the sandeels found during the 2020 post-construction survey were caught at stations located in the south-eastern section of the BOWL site. This is consistent with the distribution of sandeels within the site recorded during the 2014 survey (Figure 7.2).

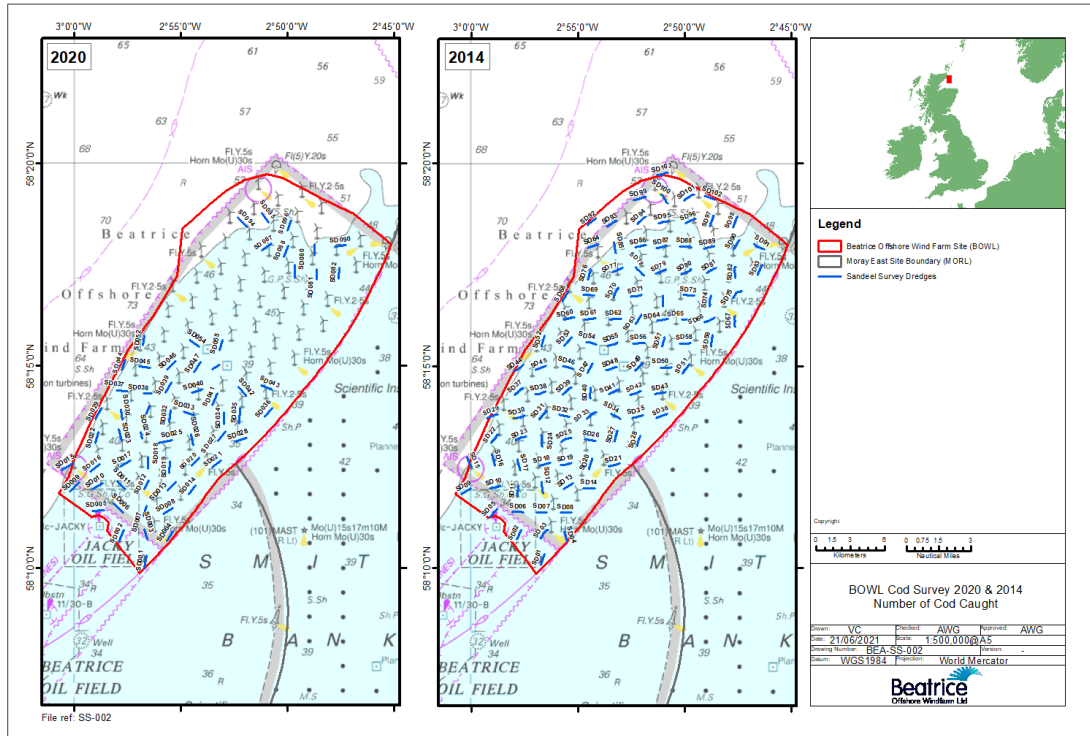

Figure 7.1 Location of sampling stations in 2014 and 2020

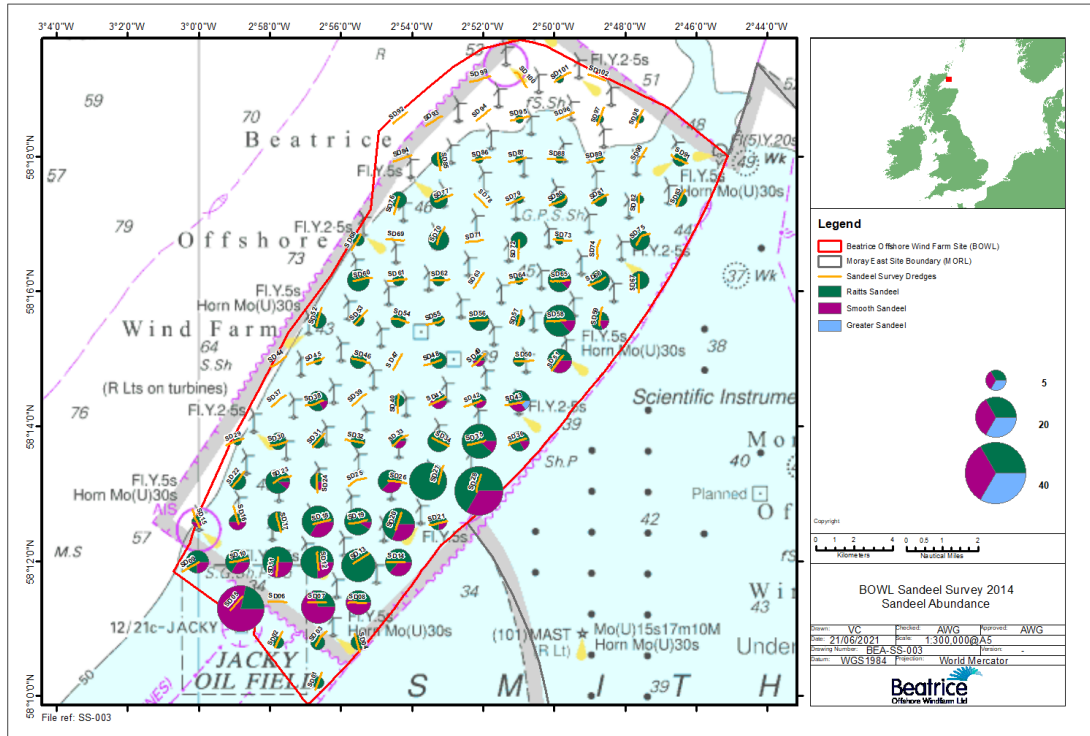

Figure 7.2 Sandeel abundance per station – 2014 survey

8 Conclusion

A total of 3,556 sandeels were caught in 58 out of the 61 stations sampled, with a maximum of 397 individuals caught at a single station. Following the same trend as in 2014, the highest numbers of sandeels were found at sampling stations located in the south-eastern section of the BOWL site.

The most abundant species was *A. marinus*, accounting for 97.31% of the total sandeel catch. The remaining three species recorded during the survey, *A. tobianus*, *G. semisquamatus*, and *H. lanceolatus* were all found in comparatively low numbers (88, five and one individuals respectively). The greatest number of individuals were recorded at stations SD018 and SD028 (397 and 393, respectively).

The results of the post-construction survey, when compared to those of the pre-construction survey, has shown an increase in sandeels in the southeast of the BOWL site and similar levels of abundance in the north to the pre-construction survey. The number of sandeels caught has increased between 2014 and 2020, with 497 individual sandeels caught in 2014 and 3,556 individual sandeels caught in 2020, despite sampling at fewer stations. There has also been an increase in the number of sandeels caught at one station, with a maximum of 36 individual sandeels caught at one location in 2014, compared to 397 individuals in 2020.

From the results of the post-construction survey there is no evidence to suggest that the construction of Beatrice Offshore Wind Farm has resulted in negative impacts on the local sandeel population.

When viewed within the wider context of the ICES SA4, the increase could be attributed to an increasing overall sandeel population in the assessment area when measured using the TAC set by ICES. A similar increase in bycatch caught between the two surveys could indicate that the whole BOWL site is healthier, and that the construction of the wind farm has had no negative effects on the local habitat and abundance of sandeels. A similar study found no detectable effect on sandeel assemblages seven years after construction of an offshore windfarm (Stenberg et al. 2011).

10 Appendices

10.1 Appendix 1 – Health and Safety

10.1.1 Personnel

Brown and May Marine (BMM) staff followed the standard health and safety protocol outlined in the BMM “Offshore Operational Procedures for Surveys using Commercial Fishing Vessels”.

All BMM staff have completed a Sea Survival course approved by the Maritime and Coastguard Agency, meeting the requirements laid down in: STCW 95 Regulation VI/1 para 2.1.1 and STCW Code section A- VI/1 before boarding any vessel conducting works for the company. Employees are also required to have valid medical certificates (ENG1), Safety Awareness, Basic Fire Fighting and Basic First Aid certificates before participating in offshore works.

10.1.2 Vessel Induction

Before boarding the survey team were shown how to safely board and disembark the vessel. Prior to departure the skipper briefed surveyors on the whereabouts of the safety equipment, including the life raft, emergency flares and fire extinguishers, and the location of the emergency muster point. The safe deck areas, man-overboard procedures and emergency alarms were also discussed. The survey team was warned about the possible hazards, such as slippery decks and obstructions whilst aboard. Surveyors were briefed about trawling operations and the need to keep clear of all winches when operational. All hazards were assessed prior to the survey in the BMM health and safety risk assessment.

10.1.3 Daily Safety Checks

The condition of the life jackets, EPIRB's, and life raft were inspected daily. Also checked were the survey team working areas, including the fish room and the wheelhouse to ensure these areas were clear of hazards such as clutter and obstructions.

10.1.4 Post Trip Survey Review

Upon completion of the survey a “Post Trip Survey Review” was filled, see Table A10.1.

Table A10.1: Post trip survey review

Project: BOWL Sandeel Survey December 2020	Vessel: Reaper
Surveyors: Alex Winrow-Giffin / John Watt	Skipper: Donald Anderson
Survey Area: Moray Firth	
Survey Dates: 08/12/2020 – 17/12/2020	

	Comments	Actions
Did vessel comply with pre trip safety audits?	Yes	Examined and passed all checks
Skipper and crew attitude to safety?	Excellent	Everyone stayed vigilant throughout the survey period
Vessel machinery failures?	None	N/A
Safety equipment failures?	None	N/A
Accidents?	None	N/A
Injuries?	None	N/A

10.2 Appendix 2 - Log of Events

A summarised log of events is given below in Table A10.2 for the sandeel survey.

Table A10.2 Summarised log of events

7th December 2020
BMM surveyor travels from office to Inverness.
8th December 2020
BMM surveyors transit to Scrabster.
Vessel met at 1530 and sampling gear loaded on board the vessel.
Vessel induction, HSE briefing conducted. Weather forecasts now unsuitable for sampling.
9th December 2020
Vessel departs Scrabster at 1050 to steam through Pentland Firth and around to site. Arrive at site too late to scout the area in daylight. Conditions not suitable for sampling.
10th December 2020
Vessel completed scouting transects for the first 40 locations during daylight hours then steamed towards Buckie to wait on weather. Conditions not suitable for sampling - waiting on weather.
11th December 2020
Vessel arrived at Buckie harbour to wait out poor weather.
12th December 2020
Waiting on weather.
13th December 2020
Waiting on weather.
14th December 2020
1350 Vessel departed Buckie to steam to site to commence sampling when seastate allows.
Commence sampling at 23:50. 12 pre-scouted stations completed.
15th December 2020
Completed 16 pre-scouted stations, clear of static gear.
16th December 2020
Completed 7 pre-scouted stations in weather window.
17th December 2020
Completed 16 pre-scouted stations, clear of static gear.
18th December 2020
Completed 10 pre-scouted stations, clear of static gear, steam to Scrabster.
19th December 2020
Demobilise vessel; surveyors travel home. Fuel taken on completion of survey 5,244 L.

10.3 Appendix 3 – Times and Coordinates

The date, times, coordinates and depth for each station are given below in Table A10.3.

Table A10.3 Start and end times, coordinates, duration and tow length of each sandeel dredge

Station	Date	Dredge Start				Dredge End				Duration (mm:ss)	Tow Length (m)

Table A10.7: By-catch species caught (no. of individuals)

Species	Latin Name	Total Count
Squat Lobster	Galathea	830
Shrimp	Decapoda	648
Dab	<i>Limanda limanda</i>	540
Common Starfish	<i>Asterias rubens</i>	280
Urchin	Echinidae	270
Polychaete	Polychaeta	220
Plaice	<i>Pleuronectes platessa</i>	193
Hermit Crab	Decapoda	190
Swimming Crab	Portunidae	144
Spider Crab	<i>Hyas sp.</i>	128
Nut Crab	<i>Ebalia sp.</i>	102
Sea Squirt	Styela	100
Bivalve	Bivalvia	97
Goby	Gobiidae	97
Long-Legged Spider Crab	<i>Macropodia rostrata</i>	96
Thickback Sole	<i>Microchirus variegatus</i>	82
Gastropod	Gastropoda	76
Brittlestar	Stellaroidea	75
Amphipod	Amphipoda	58

Species	Latin Name	Total Count
Porcelain Crab	Porcellanidae	49
Solenette	<i>Buglossidium luteum</i>	46
Common Dragonet	<i>Callionymus lyra</i>	43
Lemon Sole	<i>Microstomus kitt</i>	41
Sea Potato	<i>Echinocardium cordatum</i>	33
Sand Star	<i>Astropecten irregularis</i>	32
Clingfish	Gobiesocidae	24
Circular Crab	<i>Atelecyclus rotundatus</i>	19
Queen Scallop	<i>Aequipecten opercularis</i>	15
Whelk	<i>Buccinum undatum</i>	10
Flying Crab	<i>Liocarcinus holsatus</i>	9
Hairy Brittlestar	Ophiotrichidae	9
Scaldfish	<i>Arnoglossus laterna</i>	9
Black Clawed Crab	Decapoda	8
King Scallop	<i>Pecten maximus</i>	8
Norwegian Topnot	<i>Phrynorhombus norvegicus</i>	7
7-Arm Starfish	<i>Luidia ciliaris</i>	6
Anemone	<i>Actinaria sp.</i>	6
Pogge	<i>Agonus cataphractus</i>	6
Butterfish	<i>Pholis gunnellus</i>	5
Edible Crab	<i>Cancer pagurus</i>	4
Silverfish	Platyhelminth	4
Greater Pipefish	<i>Syngnathus acus</i>	3
Little Cuttlefish	Sepiida	3
Pout	<i>Trisopterus sp.</i>	3
Dragonet Sp.	<i>Callionymus sp.</i>	2
Fish Larvae	Osteichthyes	2
Harbour Crab	<i>Liocarcinus depurator</i>	2
Long-Spined Sea Scorpion	<i>Taurulus bubalis</i>	2
Razor Clam	<i>Ensis ensis</i>	2
Flounder	<i>Platichthys flesus</i>	1
Horse Mussel	<i>Modiolus modiolu</i>	1
Mini Ling	Lotidae	1
Nudibranch	Nudibranchia	1
Octopus (Single Row Suckers)	Octopoda	1
Pipefish	Syngnathidae	1
Reticulated Dragonet	<i>Callionymus reticulatus</i>	1
Grand Total		4,645

Table A10.8: By-catch species by presence

Species	Latin Name	Total Present
Hydroid	Hydroid	56
Hornwrack	<i>Flustra foliacea</i>	52
Dead Man's Fingers	<i>Alcyonium digitatum</i>	30
Brown Seaweed	<i>Fucus sp.</i>	18
Sea Gooseberry	<i>Pleurobrachia pileus</i>	17
Sea Chervil	<i>Alcyonidium diaphanum</i>	14
Red Seaweed	Rhodophyta	11
Bottle-Brush Hydroid	<i>Thuiaria thuja</i>	7
Kelp Seaweed	<i>Fucus sp.</i>	1
Sponge	Porifera	1
