Sampling design - Fish & benthos

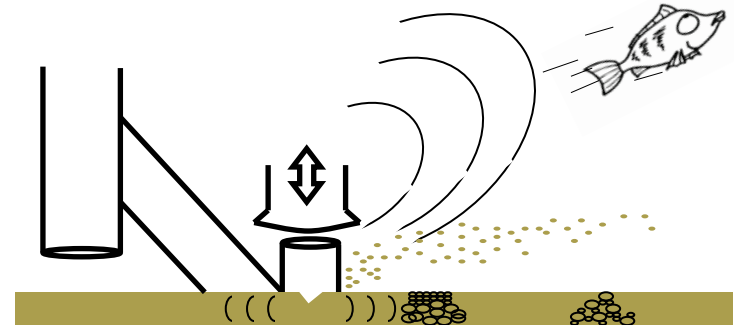

Hydroacoustic survey on pelagic fish

- Construction period -

Area	single target detection ping ⁻¹ mean ± SD (median)
Alpha ventus	0.040 ± 0.024 (0.039)
Reference	0.112 ± 0.035 (0.113)

- Scare off effects
- Patchy distribution patterns

Video & fishing survey on pelagic fish

- Operation period -

- Local aggregations of horse mackerel at FINO 1
- Snapshots

- Stationary hydroacoustic measuring system

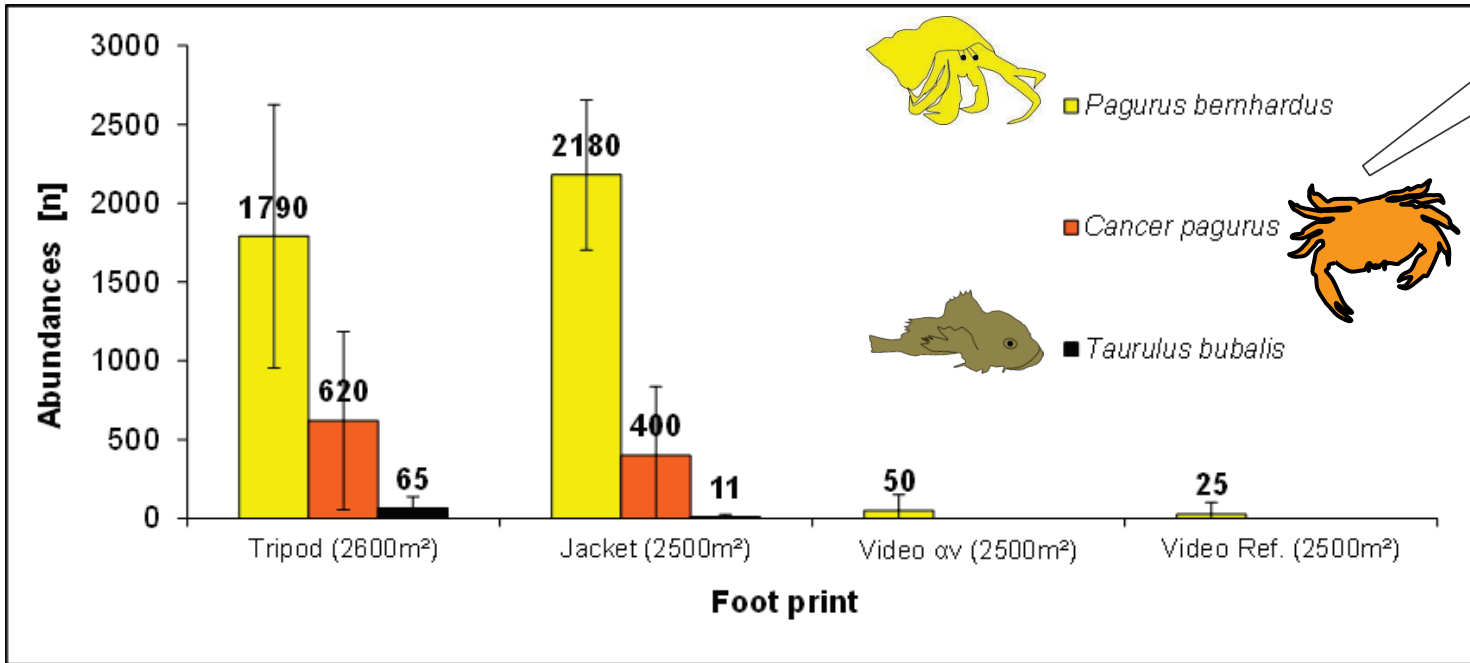

Video and diving on demersal fish & crab

- Diving transects at "Jacket" & "Tripod" foundations
- Video surveys at open areas

Video and diving on demersal fish & crab

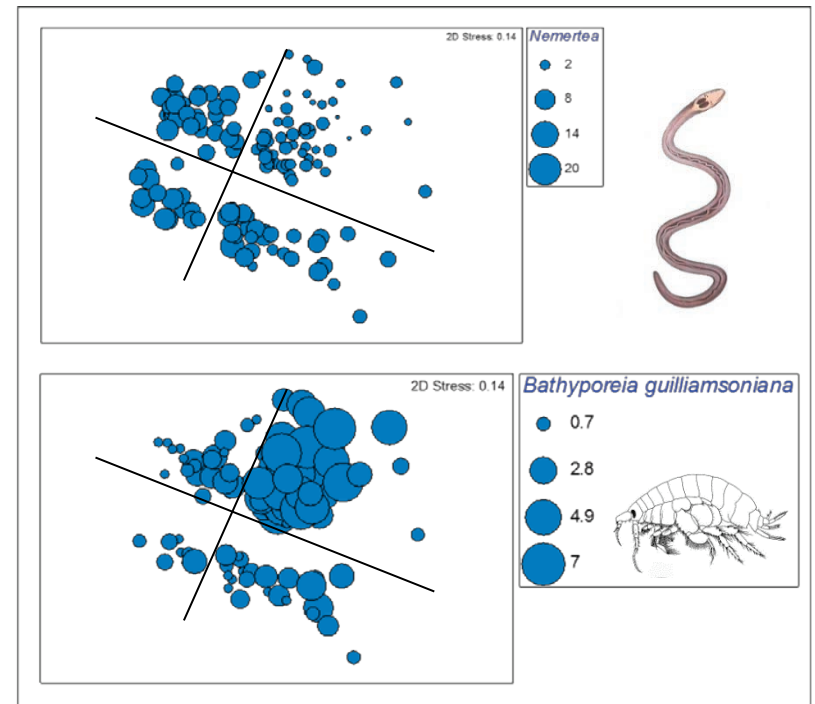

- High abundances of fish and crab at wind turbine foundations relative to open areas
- No difference between "Tripod" & "Jacket"

Survey on benthic invertebrates

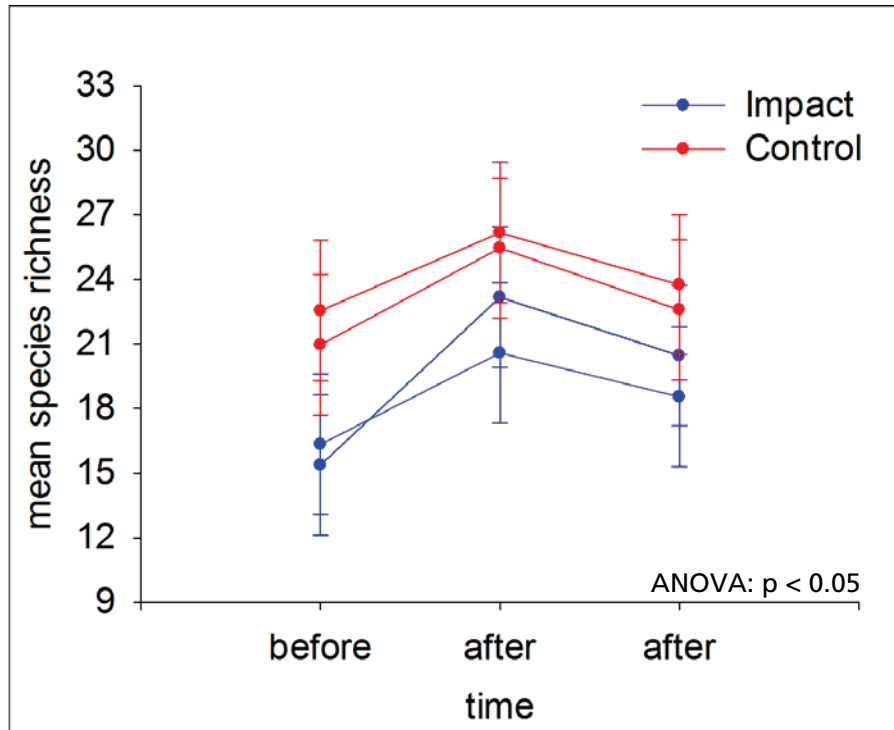

- Increased difference in endobenthos between controls and wind farm from before to after construction.

- After construction:
 - (i) nemerteans decreased
 - (ii) *B. guilliamsoniana* increased in impact locations.

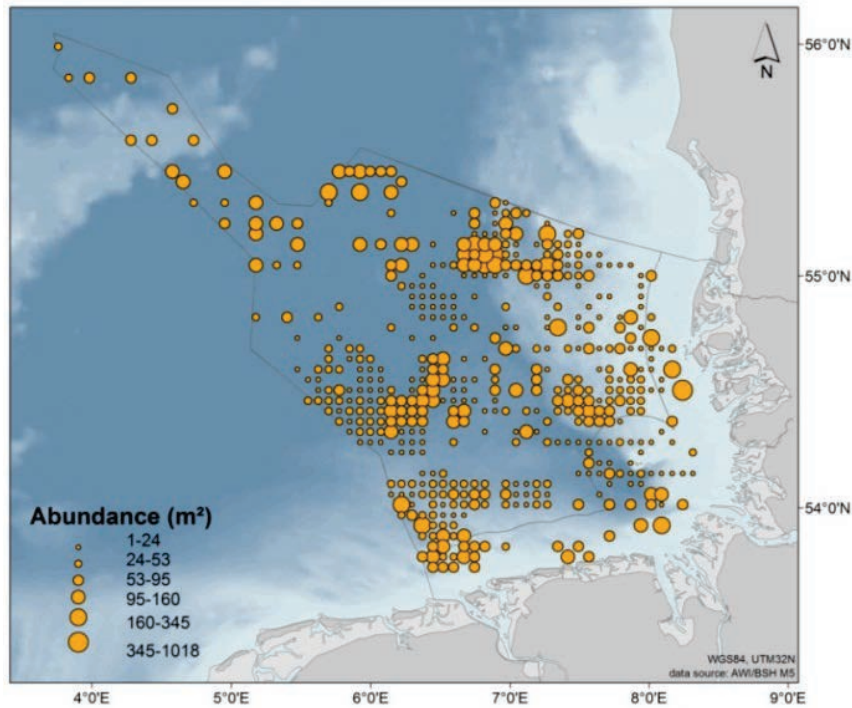

Survey on benthic invertebrates

➤ From before to after the construction mean species richness:

- (i) do not vary in control locations
- (ii) increase in impact locations.

Fish & benthos database

Average abundance (N m⁻²) of benthic invertebrates in the German EEZ (grid size: 25 km²), N = 4586 stations.

- Environmental impact assessment (EIA) data are harmonised, quality checked and analysed in combination with monitoring and research data.
- More than 9000 EIA and > 2100 AWI station entries for environmental data, fish and benthos.
- Identify benthic spatial patterns and main drivers for species distribution.

Fish & benthos database

Habitat information

Raster data (full coverage)

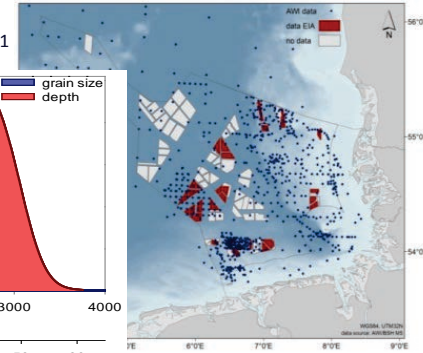

Depth & sediment
for each (grid) cell
of the raster map

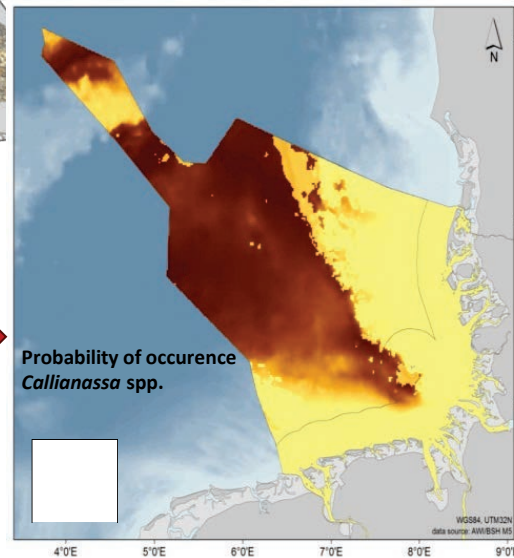

Species information

Stations (point data)

Binomial logistic regression model¹

Probability of species occurrence
at each depth and
sediment

Perspectives

- In the near future the areal extent of planned offshore wind farms will be ca. 25 % of the German exclusive economic zone.
- Large scale effects on biodiversity of fish & benthos, and thus economic value of ecosystem services are unknown so far.
- Future studies should reveal if spatio-temporal dynamics of fish & benthos at small scales will also occur at large scales.

Thank you for your attention!
